

## ABSTRACT OF THE DISCLOSURE

Disclosed herein is a motor and a washing machine with the same mounted therein. The motor includes a rotor cup having cooling-holes and lower blades formed at the bottom part thereof. The cooling-holes and lower blades are arranged such that each of the cooling-holes and lower blades is at a prescribed angle to the radial direction of the rotor cup so that the volume of blown air is increased, and thus a blowing force is also increased. The rotor cup is provided at the lower part of the circumference thereof with vents for allowing the air introduced into the inside of the rotor cup to be discharged to the outside therethrough. The rotor is provided at the upper side thereof with backward type upper blades so that the upper part of the motor is separately cooled, whereby cooling efficiency of the motor is improved.
